RHINOPLASTY (NOSE RESHAPING)

One of the most challenging surgery to the surgeon and also most rewarding to the patient since nose being the most noticeable part of our face. Depending on the case, rhinoplasty includes elevation of the depressed nose by adding cartilage, bone or silicon implant, removal of a hump, reduction of the bulk of the tip of the nose, reduction of the size of the nostrils and narrowing of the base of the nose. Rhinoplasty can be done under local or general anaesthesia based on the nature of the problem.

ABDOMINOPLASTY

Rewarding surgery, really turns forties & fiftys to teens better known as '**Tummy Tuck**', basically tightens up loose skin around the stomach area, especially for women who have given birth or who have lost an excessive amount of weight, resulting in flab. Abdominoplasty involves resection of folds of the skin of the abdomen and tightening of the abdomen muscles, to restore the lost tone during pregnancy. It can be combined with liposuction. Usually requires regional or general anaesthesia.

Before

After

LIPOSUCTION

Liposuction is safe, quick & effective way to remove unwanted fat from the body by using a tubular, metal instrument connected to a suction machine or syringe. Fat collected on the hips, thighs, buttocks, abdomen, arms, under the chin & upper torso can be reduced by this procedure.

Comprehensive Obesity Clinic:

- Non - Surgical Liposuction
- Liposuction
- Diet counselling by a qualified nutritionist
- Ketogenic enteral nutrition (Introduced from USA)
- Aerobics
- Bariatric surgery

Others

- Ear lobe surgery
- Scar revision
- Calf reduction

HAIR RESTORATION (HAIR TRANSPLANT)

Rapid hair fall always indicates a stage before baldness hence rapid hair fall should be treated properly in a holistic manner. Although male & female pattern hair loss is hereditary, begins shortly after puberty & changing life style also contribute to hair loss and baldness.

Hair transplant is a surgical procedure by which permanent hair from regions of the scalp that normally never go bald, such as sides and lower back of the head, is transferred or redistributed to areas where thinning or hair loss commonly occurs. Procedure is usually done under local anaesthesia.

Before

After

BREAST AUGMENTATION/REDUCTION /MASTOPEXY

Breast augmentation is done to enlarge an under developed breast or the one that becomes small after child birth. A silicon gel implant is placed behind the breast tissue.

Breast reduction is done to reduce the size of the breast and it is a pathological problem and patient may present with pain at the back of the chest and by this procedure excess breast tissue & skin is removed and nipple areola is relocated.

Mastopexy is done to tighten the dropping & sagging breast. Specific parts of the skin are removed from the lower part of the breasts and from around the areola, the skin is then pulled together and sutured, tightening the breast. If required nipple & areola are relocated and augmentation done with silicone gel implant.

GYNAECOMASTIA (ENLARGED MALE BREAST)

For some men breasts develops to a notable size during puberty & adolescence and it usually gets back to normal size for some it remains enlarged and associated endocrine abnormalities if present should be ruled out.

HAND AND RECONSTRUCTIVE MICROSURGERY

Hand injuries are one of the common emergencies that we come across. we manage hand injuries by microsurgical techniques, from minor injuries to major replants. Other hand problems like congenital syndactaly, radial club hand, thumb reconstruction which requires staged reconstruction are also done.
